Description:

The MSW2T-2040-193 SP2T surface mount High Power PIN Diode switch operates from 50 MHz to 4 GHz. The MSW2T-2040-193 High Power switch leverage high reliability hybrid manufacturing processes which yield both superior RF and thermal characteristics performance compared to MMIC or Glass Carrier based technologies. The hybrid design approach permits precise PIN Diode selection to optimize RF performance while maintaining competitive cost targets. The small form factor (8mm x 5mm x 2.5mm) offers world class power handling, low insertion loss, and superior intermodulation performance exceeding all competitive technologies. The MSW2040-193 symmetrical switch is tailored to minimize Transmit-to-Antenna loss while maximizing Transmit-to-Receive isolation and to enable maximum flexibility as the designer can assign either port as Transmit Port and the other as the Receive Port. The extremely low thermal resistance of the hybrid assembly permits reliably handling up to +52 dBm CW power and up to +57 dBm peak RF incident power while operating at the $T_{amb (MAX)} = +85^{\circ}C$.

Typical Applications:

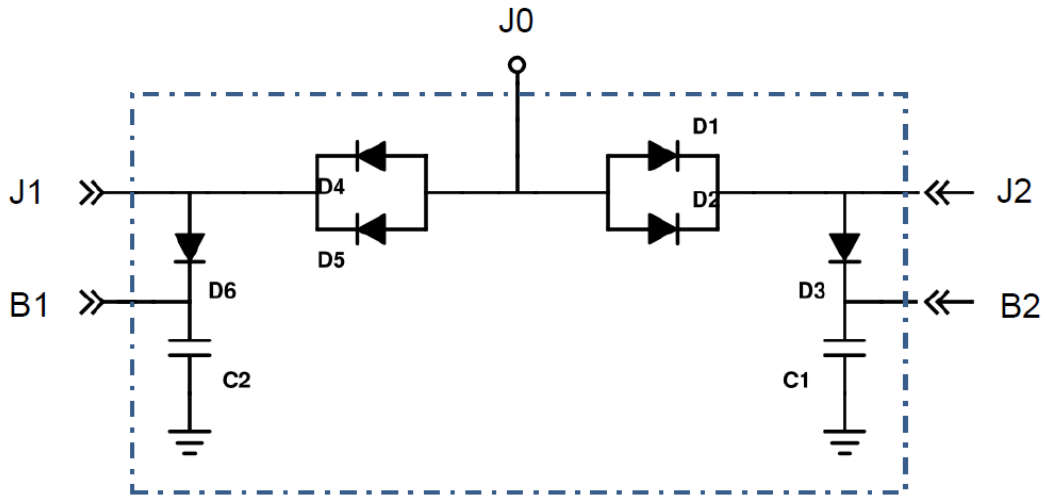

- Radar T/R Modules
- High Power Transmit/Receive Switching
- Switch Bank Filters
- Mil-Com Radios

The MSW2T-2040-193 series of High Power SP2T switches are intended for use in high power, high reliability, mission critical applications from 50 MHz to 4 GHz. The manufacturing process has been proven through decades of extensive use in high reliability applications.

Notes:

- 1) Switching time from 50% TTL to 10% or 90% RF Voltage is a function of the PIN diode driver circuit performance as well as the characteristic of the PIN diode. An RC (current spiking network) is used on the driver circuit output to provide a large transient current spike to rapidly remove stored charge from the PIN diode's intrinsic layer. Typical component values are : R = 50 to 220 Ω and C = 470 to 1,000 pF.
- 2) PIN diode minimum reverse DC voltage (V_{HIGH}) is used to maintain high resistance in the OFF PIN diode state and is determined by RF frequency, incident power, duty cycle, characteristic impedance and VSWR as well by the characteristics of the PIN diode. The recommended minimum value of the reverse bias voltage (V_{HIGH}) value is provided in the Minimum Reverse Bias Voltage Table shown below.

- 1) $28\text{ V} \leq V_{\text{HIGH}} \leq 125\text{V}$
- 2) PIN diode min reverse DC voltage (V_{HIGH}) to maintain high resistance state in the OFF PIN diode is determined by RF frequency. Incident power, duty cycle, characteristic impedance and VSWR as well as by characteristics of the diode. The recommended min reverse bias voltage (V_{HIGH}) values are provided in the Min Reverse Bias Voltage Table of this data sheet.

Thermal Design Considerations:

The design of the MWT-2040-193 family of High Power Switches permits the maximum efficiency in thermal management of the PIN Diodes while maintaining extremely high reliability. Optimum switch performance and reliability of the switch can be achieved by the maintaining the base ground surface temperature of less than 85°C.
